

## REMARKS

These remarks are made in response to the Office Action dated August 15, 2003. In the Office Action, the Examiner rejected claims 1-3,20,26,27,35, 36, 44, 45, 53, and 55 under 35 U.S.C. § 103(a) as being anticipated by Wu (WO 01/15451 A1) (hereinafter *Wu*) in view of Rao (U.S. Patent No. 6,594,826) (hereinafter *Rao*). Claims 4, 28, 37, and 46 were rejected under 35 U.S.C. § 103(a) as being anticipated by *Wu* in view of *Rao*, further in view of Katayama (U.S. Patent No. 6,349,321). Claims 5, 6, 10, 12, 13, 17, 21-25, 31, 32, 40, 41, 49 and 50 were rejected under 35 U.S.C. § 103(a) as being anticipated by *Wu* in view of *Rao*, further in view of Hendricks (U.S. Patent No. 5,600,573). Claims 7, 8, 9, 11, 14, 15, 16, 18, 19, 30, 33, 34, 39, 42, 43, 48, 51 and 52 were rejected under 35 U.S.C. § 103(a) as being anticipated by *Wu* in view of *Rao* and *Hendricks*, further in view of Graves (U.S. Patent No. 5,410,344).

No amendments to the claims have been made herein. Furthermore, none of the pending claims have been cancelled. Thus, claims 1-56 remain pending in the application. For the reasons set forth below, the Applicants respectfully request reconsideration and allowance of all pending claims.

### CLAIM REJECTIONS - 35 U.S.C. § 103

To establish a *prima facie* case of obviousness, there must first be some suggestion or motivation to modify a reference or to combine references, and second be a reasonable expectation of success. The teaching or suggestion to make the claimed combination and the reasonable expectation of success must both be found in the prior art and not based on applicant's disclosure. Third, the prior art reference (or references when combined) must teach or suggest all the claim limitations. M.P.E.P. § 706.02(j) from *In Re Vaeck*, 947 F.2d 488, 20 USPQ2d 1438 (Fed. Cir. 1991). Where claimed subject matter has been rejected as obvious in view of a combination of prior art references, a proper analysis under § 103 requires, *inter alia*, consideration of two factors: (1) whether the prior art would have suggested to those of ordinary

skill in the art that they should make the claimed device; and (2) whether the prior art would also have revealed that in so making, those of ordinary skill would have a reasonable expectation of success. Both the suggestion and the reasonable expectation of success must be founded in the prior art, not in the Applicants' disclosure. *Amgen v. Chugai Pharmaceutical*, 927 F.2d 1200, 18 USPQ2d 1016 (Fed. Cir. 1991), *Fritsch v. Lin*, 21 USPQ2d 1731 (Bd. Pat. App. & Int'f 1991). An invention is non-obvious if the references fail not only to expressly disclose the claimed invention as a whole, but also to suggest to one of ordinary skill in the art modifications needed to meet all the claim limitations. *Litton Industrial Products, Inc. v. Solid State Systems Corp.*, 755 F.2d 158, 164, 225 USPQ 34, 38 (Fed. Cir. 1985).

The examiner must present a convincing line of reasoning as to why the artisan would have found the claimed invention to have been obvious in light of the teachings of the references. M.P.E.P. § 70602(j) from *Ex parte Clapp*, 227 USPQ 972, 973 (Bd. Pat. App. & Inter. 1985). Obviousness cannot be established by combining references without also providing evidence of the motivating force which would impel one skilled in the art to do what the patent applicant has done. M.P.E.P. § 2144 from *Ex parte Levengood*, 28 USPQ2d 1300, 1302 (Bd. Pat. App. & Inter. 1993) (emphasis added by M.P.E.P.).

#### Traversal of the Rejection of the Claims under 35 U.S.C. § 103

Applicant respectfully asserts the rejection of independent claim 1 under 35 U.S.C. § 103(a) as being unpatentable over *Wu* in view of *Rao* is improper and should be withdrawn. Claim 1 recites:

1. A method for generating a broadcast schedule, comprising:

***broadcasting meta-data*** to a plurality of client systems, the meta-data including descriptions of a plurality of pieces of content that ***are in consideration for upcoming broadcasts by a broadcast operations center***;

receiving individual sets of client demand feedback data from at least a portion of said plurality of client systems, ***each individual set of client demand feedback data comprising data indicating a client interest level in at least a portion of the plurality of pieces of content***;

maintaining a broadcast schedule queue comprising an ordered list of pieces of content that indicates relative levels of client interest in each piece of content that are derived from an aggregation of the client demand feedback data; and

selecting a batch of content comprising one or more pieces of content from a top portion of the broadcast schedule queue to be broadcast during a next broadcast schedule window based on a size of said one or more pieces of content in combination with an available bandwidth for the next broadcast schedule window. (Emphasis Added)

In rejecting claim 1, the Examiner asserts that "Wu discloses a list and/or grid (meta data) of future programs could be shown to the user," citing page 9, lines 2-5. The cited lines state:

Other menu options, might provide future schedules and one touch recording requests. For example, a list and/or grid of *future programs/segments* could be shown and a signal from the input 126 could set the program/segment *to record*. (Emphasis added)

This clearly does not read on the portion of the first subparagraph of claim 1 that does not concern broadcasting. First of all, there is no teaching or suggestion that the meta data (that are broadcast to the clients) includes descriptions of a plurality of pieces of content that *are in consideration for upcoming broadcasts by a broadcast operations center*. Clearly, the list and/or grid contains data identifying future programs and/or segments that are to be broadcast, with the purpose being to enable the broadcast of those programs and/or segments to be recorded.

While acknowledging that *Wu* does not teach broadcasting meta-data, the Examiner asserts that *Rao* teaches this element, citing *Rao*, column 9, lines 47-65 and the abstract). Part of the cited paragraph states, "For example, in one embodiment that is compliant with the European /digital Video Broadcasting (DVB) standard, both program data and Service Information (SI) (which carries the electronic program guide) data will typically be simultaneously delivered to the subscriber unit as known to those of skill in the art" (Col. 9, lines 48-53). The program data relates to the program content – that is the data that are broadcast that are processed to cause the program to be viewed. The program data are not meta-data. The SI data relates the electronic program guide. The electronic program guide is a standard electronic program guide that

contains a schedule for upcoming broadcasts. These are programs that are actually going to be broadcast, not *in consideration for upcoming broadcasts*.

Furthermore, the *Wu* and *Rao* references, either alone or in combination, do not teach receiving client demand feedback pertaining to the pieces of content in consideration for an upcoming broadcast and maintaining a broadcast schedule queue that is derived from processing the client demand feedback.

In *Wu*, the list and/or grid contains data relating to future program/segments that are to be broadcast, and the user uses input 126 to set the recording device to record the program/segments when they are broadcast. More specifically, *Wu* states, "The computer 122 can also provide the *schedule for both the broadcast streams 114 and the on demand streams 116* over the data channel 118" (page 7, lines 9-10).

Furthermore, the information in the lists and/or grid is not used for rating purposes whatsoever. In contrast, the meta-data broadcast under claim 1 are directly tied to the client demand feedback data, as the meta-data pertain to the pieces of content in consideration for upcoming broadcasts, and the client demand feedback data relates to client demand of those pieces of content. The overall information exchange between the broadcast system and the client systems is concisely articulated in the abstract of the present application:

A method and system for periodically deriving an optimal batch broadcast schedule based on client demand feedback data from a distributed set of broadcast clients. The broadcast system includes an operation center that broadcasts meta-data to a plurality of client systems. The *meta-data describes a plurality of pieces of content that are in consideration for upcoming broadcasts* by the server. Each client receives the broadcasted meta-data from and sends back a set of client demand feedback data to the operations center, wherein the user *feedback data reflects a client's interest level in at least a portion of the pieces of content*. The feedback data, which typically may include ratings and/or relative rankings, may be user-generated, automatically-generated, or a combination of the two. The system then send a batch of content based on an aggregation of the feedback data in combination with available broadcast bandwidth and broadcast schedule window.

Claim 1 covers the server-side (i.e., the broadcast operations center) operations.

The user's requests for programming under *Wu* do not relate to pieces of content in consideration for upcoming broadcasts that have already been defined for consideration by the broadcast operations center. Rather, user programming request may concern not only available program segments, but program segments that are not even available for broadcast due to their unavailability (see page 13, lines 11-15). In fact, the user may enter a "free form request" (page 10, lines 12-17) under which a user enters information via a keyboard corresponding to the request, such as "Pakistani news." This request may not correspond with any particular program, and certainly doesn't relate to pieces of content being described by meta-data.

In addition, there is nothing in either the *Wu* or *Rao* references that would motivate one of ordinary skill in the art to combine the teachings with respect to the use of the electronic program guide for any other purpose than its ordinary use. In other words, there would be no motivation to use information in the electronic program guide to base client demand feedback on.

Based on the foregoing arguments, the applicant respectfully asserts that the rejection of independent claim 1 over *Wu* in view of *Rao* is unsupported, and thus is improper and should be withdrawn. Each of claim 2-25 depend either directly or indirectly from independent claim 1. Accordingly, each of claims 2-25 are patentable over the cited art for at least the same reasons as claim 1.

Independent claim 26 is an apparatus claim for performing the method of claim 1. Accordingly, independent claim 26 includes claim elements that are analogous to those recited in claim 1. Thus, applicant respectfully asserts that independent claim 26 is patentable over the cited art for similar reasons to those presented above in support of the patentability of claim 1. Additionally, independent claim 36 is a Beauregard claim covering software for performing the method of independent claim 1. Accordingly, independent claim 36 is patentable over the cited art for similar reasons to those presented above in support of the patentability of claim 1. Furthermore, each of claims 27-35, and claims 37-43, which depend directly or indirectly from either of independent claims 26 or 36 is in condition for allowance for at least the same reason as their respective base claim.

Claim 44 is a system claim covering both the client and server side operations of the present invention. Since the server-side operations (claimed in independent claims 1, 25, and 36 above) are patentable, the combination of the client and server-side operations is also patentable for at least the same reasons supporting patentability of the server-side operations. Accordingly, each of independent claim 44, and claims 45-56 dependent thereon are patentable in view of the cited art.

With further respect to claims 3, 27, and 36, the applicant respectfully asserts that *Wu* does not teach the limitations of resetting the client demand feedback data for a given piece of content in response to a broadcast of that content such that the piece of content cannot be selected again for a subsequent broadcast until new client demand feedback data corresponding to that piece of content is received.

The discussion cited by the examiner with respect to the rejection of claim 3 (page 12, lines 12-32) says nothing about resetting client demand feedback data for a given piece of content in response to broadcast of that content. Rather, it says the (client) request can be held for varying predetermined periods, such as a predetermined time each day. There is nothing to suggest that client demand feedback data (requests) for a given piece of content are reset once the content is broadcast. In fact, under *Wu*, the requests could be reset based on a predetermined time in a manner that is completely independent of whether content is broadcast or not.

#### Conclusion

Overall, none of the references singly or in any motivated combination disclose, teach, or suggest what is recited in the independent claims. Thus, given the above remarks, independent claims 1, 26, 36, and 44 are now in condition for allowance. The dependent claims that depend directly or indirectly on these independent claims are likewise allowable based on at least the same reasons and based on the recitations contained in each dependent claim.

If the undersigned attorney has overlooked a teaching in any of the cited references that is relevant to the allowability of the claims, the Examiner is requested to specifically point out where such teaching may be found. Further, if there are any informalities or questions that can be addressed via telephone, the Examiner is encouraged to contact the undersigned attorney at (206) 292-8600.
